

Ex:8 Designing User Interface (UI) Wireframes for an E-commerce Mobile Application(Balsamiq)

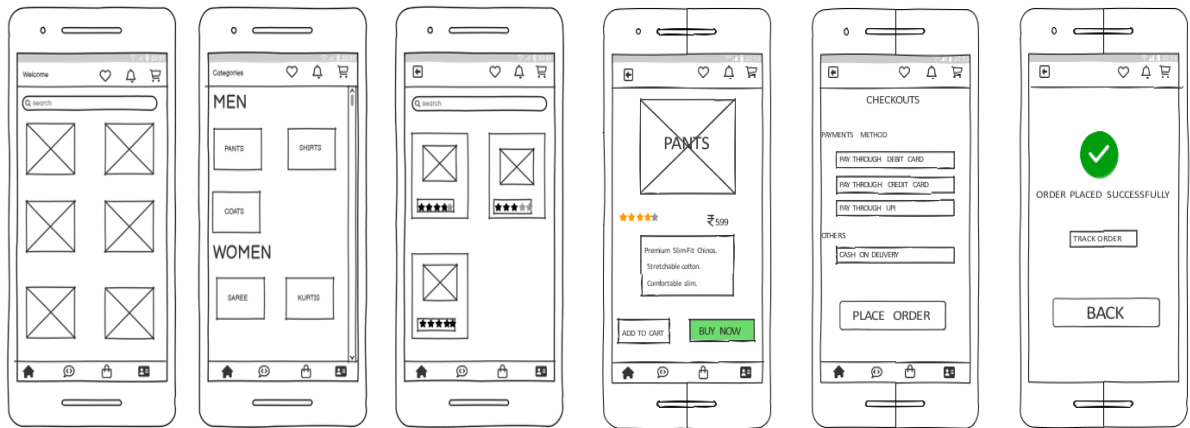

Aim

To design and document the sequential user flow of a mobile e-commerce application, focusing on the journey from product discovery to successful order placement.

Procedure

The design process followed a standard 6-stage user flow:

1. **Home Screen Design:** Created a landing page featuring a search bar, a grid layout for featured products/categories, and a bottom navigation bar for easy access to Home, Categories, Cart, and Profile.
2. **Category Selection:** Developed a "Categories" page organized by gender (Men, Women) and product types (Pants, Shirts, Sarees, etc.) to help users narrow their search.
3. **Product Listing:** Designed a results page that displays product thumbnails, search functionality, and star ratings to assist in user decision-making.
4. **Product Detail View:** Created a dedicated page for a specific item (e.g., "Pants") showing price (₹599), product descriptions, ratings, and primary call-to-action buttons like "Add to Cart" and "Buy Now."
5. **Checkout & Payment:** Developed a checkout interface listing various payment methods, including Debit Card, Credit Card, UPI, and Cash on Delivery (COD), with a final "Place Order" button.
6. **Confirmation Screen:** Designed a final success state featuring a visual confirmation (green checkmark), an "Order Placed Successfully" message, and options to "Track Order" or return "Back" to the home screen.

Results

The wireframes successfully illustrate a logical and intuitive **User Experience (UX)**.
